

1. The complete customer journey

Use one workflow for website, telephone, email, WhatsApp and walk-in customers.

1 Request

The customer selects products online, or staff open Admin > Quotations > New quotation and capture the request.

2 Provisional quotation

The system records the requested products, price, stock and supplier snapshot. This is not a request for payment.

3 Final review

Staff confirm quantity, selling price, delivery, discount, terms and approved banking details, then email the final PDF.

4 Customer decision

The customer accepts or rejects the exact final version and amount in their account.

5 Payment verification

The customer pays online or uploads EFT proof. An order becomes active only after payment is verified.

6 Fulfilment and delivery

Staff process or source products, pack the order, arrange delivery and record delivery evidence.

2. Capture and prepare a quotation

Do not create separate processes for online and offline customers.

Online request

The customer signs in, adds products, confirms contact details and requests a priced quotation. Open it from Admin > Quotations.

Telephone or offline request

Open Admin > Quotations > New quotation. Enter name, email, optional phone and company, requested lines and only essential notes.

New customers

The system matches customers by email. If none exists, it creates a customer record automatically. Do not create a duplicate customer first.

Review the provisional quote

Open the quotation. Confirm every product, quantity, internal cost, availability and customer unit price. Never expose internal cost to the customer.

Issue the final quote

Add delivery or discount only when required. Confirm terms and banking details, then select Approve and email final quotation.

Email check

The customer receives the PDF and support is copied. If delivery fails, check the email outbox and retry the failed notification.

3. Acceptance and payment

Never begin fulfilment because a quote was issued or proof was merely uploaded.

Customer acceptance

The customer opens Quotations, reviews the final PDF and selects Accept quote. Acceptance stores the exact version and amount.

Staff-assisted acceptance

If the customer cannot use the portal, help them access their account. Do not record acceptance without clear customer authority and an audit trail.

Online payment

After acceptance, the customer can choose Pay securely online. Paystack must return to shop.innozanzi.co.za.

EFT payment

After acceptance, the customer uploads proof for the exact quotation total. Open Admin > Payments and verify the actual bank receipt before approval.

Verification boundary

Approving payment rechecks local or supplier availability, activates the order, records source snapshots and emails the customer and support.

Do not proceed when

The amount differs, the quote expired, stock changed, proof is unclear, the bank receipt is missing, or the accepted version no longer matches.

4. Fulfilment, delivery and daily control

Keep customer-facing status accurate; each meaningful update sends email.

Process

Open Admin > Orders. Move a verified order through Processing, Sourcing items when needed, Items received, Packing and Ready for delivery.

Source supplier items

Use the supplier and SKU stored on the order line. Confirm availability and purchasing references without replacing the historical quotation snapshot.

Arrange delivery

Create or open the delivery note, confirm delivery address and responsible staff, then schedule the courier and tracking details.

Complete delivery

Record Dispatched, In transit and Delivered accurately. Upload proof of delivery or other evidence before completing the order.

Daily checks

Review Overview, Quotations, Payments and Orders. Resolve failed email notifications, expired quotes, stock exceptions and overdue deliveries.

Golden rule

If the system status, email, document and real-world event disagree, stop and correct the record before moving to the next stage.
